

Reviewer Comments:

Reviewer 1

The authors have addressed the questions I posed after the first round of review. I have a minor recommendation: it will be worthwhile if the authors could give the size of the image/volume in pixels that they use in the simulations. This will give some context to the severity of angular and translation misalignments (for example a misalignment of 20 pixels for a 2000 X 2000 pixel image is a lot less severe, than the same misalignment for a 500 X 500 image).

Conditions included in Figure caption 7. Image volume used is 128x128x128, errors are typically smaller than e^{-5} so we considered this to be acceptable. Errors would be smaller using larger image volumes and additional fiducials.
